Overview

- 1 Introduction
- 2 Data Understanding
- 3 Cluster Analysis
- 4 Forecasting

The analysis' purpose

To **discover** the clusters among the criminal activities in the London metropolitan area in a distinct window of time and to **forecast** a possible development for future crimes.

The Dataset(1)

London Crime Data, 2008-2016: this dataset, hosted by **Kaggle**, is composed by 13 millions rows describing the London metropolitan area's criminal activities by *Borough*, *Category, Month* and *Year* in a window of time that ranges from January 2008 to December 2016.

The Dataset(2)

The dataset is composed by 7 variables:

- Isoa_code: code for Lower Super Output Area in Greater London;
- borough: common name for London borough;
- major_category: high level categorization of crime;
- minor_category: low level categorization of crime within major category;
- **year**: year of reported counts, 2008 − 2016;
- **month**: month of reported counts, 1-12;
- value: monthly reported count of categorical crime in given borough;

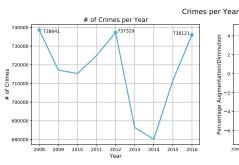

The Dataset(3)

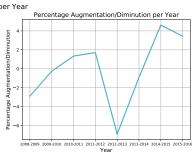

The variables *Isoa_code*, *borough*, *major_category*, *minor_category*, *year* and *month* are **categorical** variables, while *value* is a **discrete numerical** variable.

Numeric Variables' Analysis

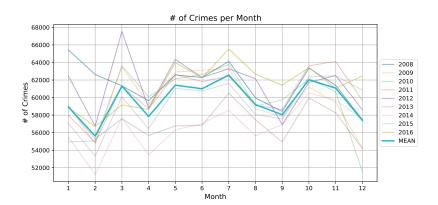

value is the only numeric variables in the dataset, its **mode** is 0, which appears in the 74.56% of the dataset's samples (10,071,505 records). We can conclude that, on a superficial level, the window of time from 2008 to 2016 wasn't too dense of criminal activities.

Crimes per Year

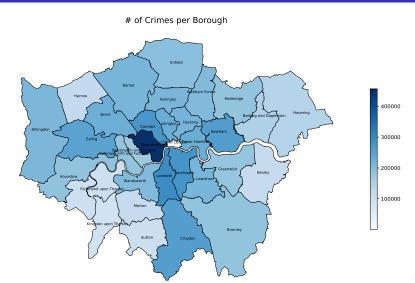

Crimes per Month

Categorical Variables' Analysis

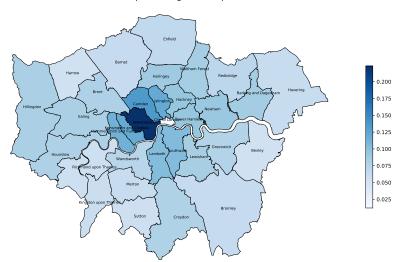

- borough has 33 unique values, of which Lambeth is the most frequent, appearing in the 4.47% of the cropped dataset's records;
- major_category has 9 unique values, of which Theft and Handling is the most frequent, appearing in the 33.25% of the cropped dataset's records;
- year has 9 unique values, of which 2016 is the most frequent, appearing in the 11.45% of the cropped dataset's records;
- month has 12 unique values, of which 7 is the most frequent, appearing in the 8.66% of the cropped dataset's records;

Crimes per Borough

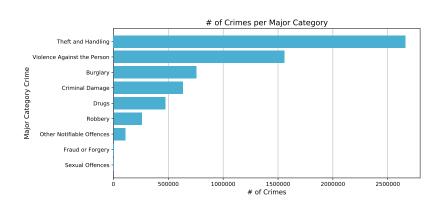

Crimes per Borough over Population Density

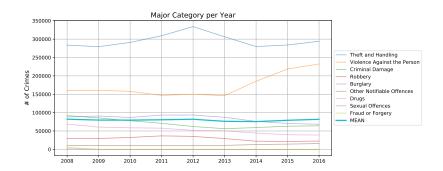

of Crimes per Borough over Population

Crimes per Major Category

Major Category Crimes per Year

Correlation Analysis

\$	Isoa_code \$	borough \$	major_category \$	minor_category \$	value \$	year \$	month \$
Isoa_code	D	D	D	D	D	D	- 1
borough	D	D	D	D	D	D	D
major_category	D	D	D	D	D	D	D
minor_category	D	D	D	D	D	D	D
value	D	D	D	D	D	D	D
year	D	D	D	D	D	D	D
month	1	D	D	D	D	D	D

Introduction

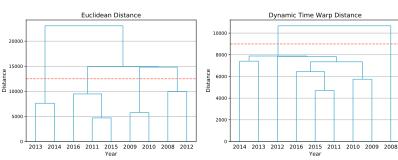

I have decided to enrich the informations provided with the data understaning by searching for possible **cluster-like structures** in the **time series** extracted from the main dataset, that is, hoping to discover the similarities (or dissimilarities) among the series describing the criminal activities from 2008 to 2016

Choice of the Algorithms

I have used three popular clustering algorithms, that is, the KMeans algorithm, the Hierarchical Agglomerative algorithm and the DBSCAN. The three algorithms were adapted depending on the different series they were applied on.

By-Year Series: Hierarchical Agglomerative Clustering

By-Year Series: Hierarchical Agglomerative Clustering

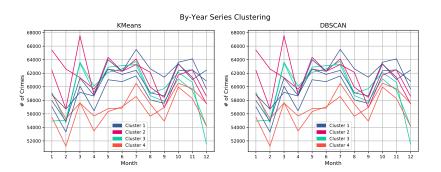

By-Year Series: KMeans Algorithm and DBSCAN Clustering(1)

\$	Cluster \$	\$	Cluster \$
Year \$	\$	Year ≑	\$
2009	0	2008	-1
2010	0	2012	-1
2011	1	2009	0
2015	1	2010	0
2016	1	2011	1
2008	2	2015	1
2012	2	2016	1
2013	3	2013	2
2014	3	2014	2

(a) KMeans (b) DBSCAN

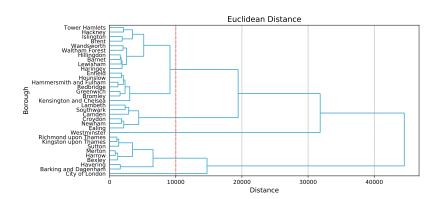

By-Year Series: KMeans Algorithm and DBSCAN Clustering(2)

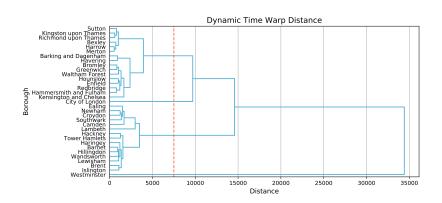

By-Year Series: Conclusions

- the series representing years 2013 and 2014 are the least dense of criminal activities, hence are clustered together;
- the series representing years 2008 and 2012 are the most dense of criminal activities, hence are clustered together;
- the remaining series are splitted into two distinct clusters;

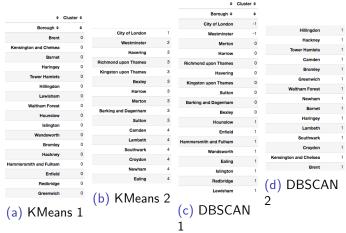

By-Borough Series: Hierarchical Agglomerative Clustering(1)

By-Borough Series: Hierarchical Agglomerative Clustering(2)

By-Borough Series: KMeans Algorithm and DBSCAN Clustering

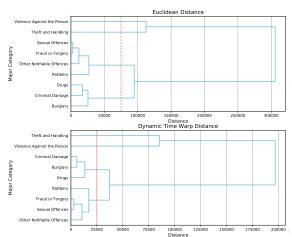

By-Borough Series: Conclusions

■ The series representing Westminster and City of London are the two extremes among the boroughs, hence they are clustered by the themself in dinstinct clusters;

By-Major Category Series: Hierarchical Agglomerative Clustering

By-Major Category Series: Hierarchical Agglomerative Clustering

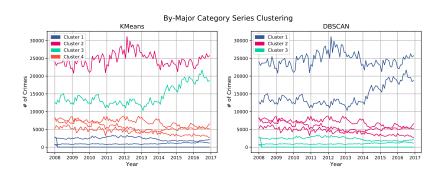

By-Major Category Series: KMeans Algorithm and DBSCAN Clustering(1)

(a) KMeans

(b) DBSCAN

By-Major Category Series: KMeans Algorithm and DBSCAN Clustering(2)

By-Major Category Series: Conclusions

- Fraud or Forgery, Sexual Offences, Other Notifiable Offences and Robbery are the least popular types of crimes, hence their series are clustered together;
- Theft and Handling and Violence Against the Person are the most popular types of crimes, hence they form distinct clusters for themeself:
- the other categories are clustered together;

The Models - ARIMA Family Models

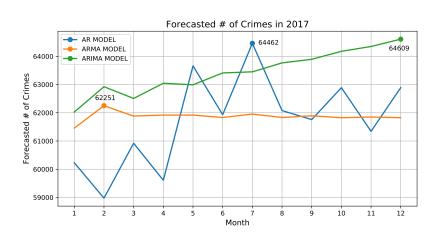

Represent by the formulas:

AR Model:
$$X_t = c + \sum_{i=1}^p \varphi_i X_{t-i} + \varepsilon_t$$

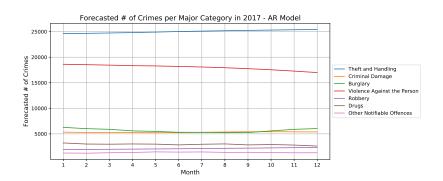

ARMA Model: $X_t = c + \sum_{i=1}^p \varphi_i X_{t-i} + \varepsilon_t + \sum_{i=1}^q \theta_i \varepsilon_{t-i}$

ARIMA Model $\left(1 - \sum_{i=1}^p \varphi_i L^i\right) (1 - L)^d X_t = \left(1 + \sum_{i=1}^q \theta_i L^i\right) \varepsilon_t$

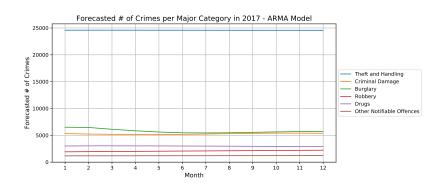

Forecasting of # of Crimes over the city

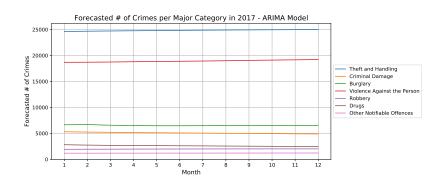

Forecasting of # of Crimes per Major Category - AR model

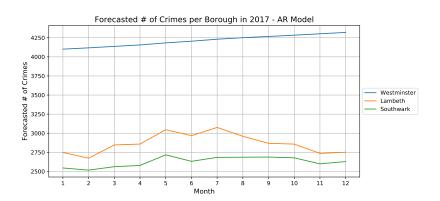

Forecasting of # of Crimes per Major Category - ARMA model

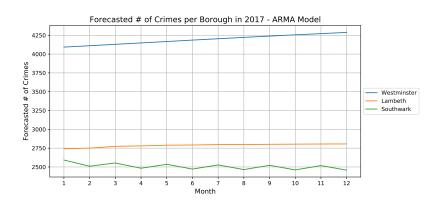

Forecasting of # of Crimes per Major Category - ARIMA model

Forecasting of # of Crimes per Borough - AR model

Forecasting of # of Crimes per Borough - ARMA model

Conclusions

- The **AR Model** returns the better forecasting for the # of crimes over the city;
- The AR Model and the ARIMA Model returns the better forecastings for the # of crimes per major category;
- The **AR Model** returns the better forecasting for the # of crimes per borough;
